

POLIMI GRADUATE SCHOOL OF MANAGEMENT

INTRODUCTION TO NATURAL LANGUAGE PROCESSING

Andrea Mor - andrea.mor@polimi.it

CONTENTS

- ▶ Introduction
- ▶ Data Preparation
- ▶ Topic Modeling
- ▶ Sentiment Analysis
- ▶ Word embedding: Word2vec and Glove
- ▶ RNN - Long Short Term Memory networks (LSTM)

SOME IMPORTANT QUESTIONS

- ▶ What is the meaning of a word?
- ▶ How we can represent it?
- ▶ Which are the limits/problems of a representation?

TEXT CLEANING

- ▶ Convert to lower case
- ▶ Remove punctuation
- ▶ Remove numerical values
- ▶ Typos
- ▶ Remove special characters ([?@)
- ▶ Remove stop words (the, it, etc)
- ▶ Remove special description words ([chorus], [fade], [applause])
- ▶ Tokenize text (O'Neill → [o] [neill], [o'neill]?; aren't → [arent], [are][nt]?)
- ▶ Create bi-grams or tri-grams ([United Kingdom] vs [United][Kingdom])
- ▶ Normalization:
 - Stemming (car, cars, car's, cars' → car;)
 - Lemmatization (am, are, is → be)

TEXT REPRESENTATION

1. Corpus: a collection of text
2. Document-Term Matrix: word counts in matrix format
3. TF-IDF: Term Frequency - Inverse Document Frequency

$$\text{TF-IDF} = f_{t,d} \times \text{idf}(t, D)$$

where

- $tf(t)$: the number of times that term t occurs in document d .
- $\text{idf}(t, D) = \log \frac{|D|}{|\{d \in D: t \in d\}| + 1}$: log of the inverse of the number of documents containing term t .

SENTIMENT ANALYSIS

- ▶ TextBlob Module: Linguistic labeled the sentiment of words.
<https://github.com/sloria/TextBlob/blob/eb08c120d364e908646731d60b4e4c6c1712ff63/textblob/en/en-sentiment.xml>
- ▶ Sentiment Labels: Each word is labeled in terms of
 - Polarity: negative(-1) or positive(+1)
 - Subjectivity: subjective(0) or fact(+1)
- ▶ Sentiment of words can vary based on where it is in a sentence.
 - Negation multiplies the polarity by -0.5

TOPIC MODELING - LSA

Latent Semantic Analysis (LSA)

- **Singular Value Decomposition (SVD)** of the Document-Term Matrix

TOPIC MODELING - LDA

Latent Dirichlet Allocation (LDA)

- ▶ **Documents (M) are probabilistic distribution over topics:** let say that a document is $p_i\%$ of topic i .
- ▶ **Topics are probabilistic distribution over words:** given a topic chosen according to the distribution of the document, we generate a word according to the topic distribution
- ▶ Random initialisation: assign each word to a random topic
- ▶ Update each word by considering
 - proportion of words in the document of topic
 - proportion of topics in all documents for the word
- ▶ We sample until a “reasonable” result

WORD EMBEDDING

Distributed Representations of Words (a.k.a. word embeddings) are geometric representation of words/entities learned from the data/corpus in such a way that semantically related words are often close to each other. In practice we attempt to embed entities onto a low-dimensional metric space in which similar words are placed close

DISTRIBUTIONAL HYPOTHESIS

“You shall know a word by the company it keeps”

(Firth, 1957)

Similar words tend to occur in similar contexts, therefore a word can be represented based on the co-occurrence across the data in the same context (word window).

WORD2VEC INPUT

Source Text	Training Samples
<div>The quick brown fox jumps over the lazy dog.</div>	<div>(the, quick)</div> <div>(the, brown)</div>
<div>The quick brown fox jumps over the lazy dog.</div>	<div>(quick, the)</div> <div>(quick, brown)</div> <div>(quick, fox)</div>
<div>The quick brown fox jumps over the lazy dog.</div>	<div>(brown, the)</div> <div>(brown, quick)</div> <div>(brown, fox)</div> <div>(brown, jumps)</div>
<div>The quick brown fox jumps over the lazy dog.</div>	<div>(fox, quick)</div> <div>(fox, brown)</div> <div>(fox, jumps)</div> <div>(fox, over)</div>

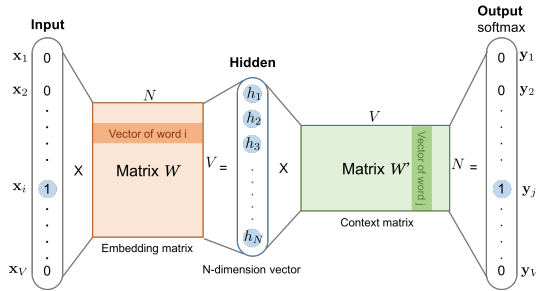

1

2

WORD2VEC SKIP-GRAM

A single-layer architecture based on the inner product between two word vectors.

$$\underbrace{e_i^\top}_{h} \times W_{N \times d} \times W'_{d \times N} \rightarrow^{\text{softmax}} \mathbb{P}(\text{word}_j | \text{word}_i)$$

We maximize $\frac{1}{T} \sum_{t=1}^T \sum_{-c \leq k \leq c, k \neq 0} \log(p(w_{i+k} | w_i))$ where $p(o|c) = \exp(v_o^\top v_c) / \sum_{w=1}^V \exp(u_w^\top v_c)$

WORD2VEC CBOW

$$h = \frac{1}{|\text{window}|} \sum_{i=1}^{|\text{window}|} e_i^\top \times W_{N \times d}$$

COSINE SIMILARITY

Similarity distance measure as the cosine similarity:

$$\text{cosine similarity}(a, b) = \frac{v(a)^\top v(b)}{\|v(a)\| \|v(b)\|}$$

GLOVE

- ▶ We use the co-occurrence matrix for the entire corpus.
- ▶ As in SVD we try to encode a matrix into some “principal components”
- ▶ As in word2vec the probability of the context word given the central word is proportional to the dot product of vector representations.

counts	I	like	enjoy	deep	learning	NLP	flying	.
I	0	2	1	0	0	0	0	0
like	2	0	0	1	0	1	0	0
enjoy	1	0	0	0	0	0	1	0
deep	0	1	0	0	1	0	0	0
learning	0	0	0	1	0	0	0	1
NLP	0	1	0	0	0	0	0	1
flying	0	0	1	0	0	0	0	1
.	0	0	0	0	1	1	1	0

Example corpus:

- I like deep learning.
- I like NLP.
- I enjoy flying.

$$J(\theta) = \frac{1}{2} \sum_{i,j=1}^W f(P_{ij})(u_i^T v_j - \log P_{ij})^2$$

ANALOGICAL REASONING

The city of Rome is in relation with the country Italy in the same way as the city of Paris is in relation with the country France.

The propositional analogy task: find an x such that $Rome : Italy = x : France$

Male-Female

Verb tense

Country-Capital

$$v(Italy) - v(Rome) \sim v(France) - v(Paris)$$

IMPLEMENTATIONS

- ▶ Neural Network: Word2Vec [Mikolov+, 2013], ELMO [Peters+,2018]
<https://code.google.com/archive/p/word2vec>
- ▶ GloVe [Pennington+,2014]. Matrix Factorization/Neural Network.
<https://nlp.stanford.edu/projects/glove/>

THANK YOU
